

The Aquatic Animal Health, Welfare and Ecosystem Health Session

Thematic Focus: *Controlling Antimicrobial Resistance (AMR) in Aquaculture – A One Health Imperative*

Antimicrobial resistance affects not just fish health but also the health of our aquatic ecosystems, blue food systems, and communities. This emerging threat to the sustainability of aquaculture compels us to innovate.

Come join us at World Aquaculture 2026 in Tanzania, which is leading the transition from reactive treatments to proactive, resilient aquatic farming. This dedicated session is your platform to share experiences that showcase the science, policies, and practical solutions that will define the next decade of One Health in aquaculture.

We invite all stakeholders and practitioners:

- Oral and poster abstract submissions on evidence-based strategies and real
- experiences
- Exhibitors and sponsors connect directly, showcase your One Health
- solutions to the value chain
- Organize dedicated side-events, workshops and round-tables

Submit your abstracts and express your interest to exhibit, sponsor or organize a side event at https://was.org/meeting/code/afraq26

Healthy animals, Healthy ecosystems, Healthy people

One Health = Resilient Blue Food Systems.
